HOW THE BRAIN REMEMBERS

Help us learn more about how our brains remember what we learn and need to use daily!

Dr. Larson-Prior and her research team at the University of Arkansas for Medical Sciences are conducting a study on the brain's ability to remember learned events. *We are looking for adults interested in participating in memory research*

Healthy adults (>18 years old) will participate in one session where their brain activity will be recorded as they learn and recall new scenes, words and letters. Results will provide important information about memory loss in epilepsy. Participants will be compensated for their time.
